

Validata Explorer

An automated recording and digital **e-learning** assistant to accelerate your test automation journey!

Validata Explorer is a powerful application available from the cloud or through your existing training system (Moodle, etc), designed for non-technical automation experts to enable them to record business processes and test automation workflows across their systems.

It is so easy to use, so that manual testers with no previous experience in test automation, can record their business processes and then instantly convert them into end-to-end automated test cases. Temenos business users are now able to record test automation workflows linked to their business processes and create end-to-end test cases without the need of an automation engineer. All user actions on screen are recorded and captured as test steps.

The main differentiator from other recording solutions is that it is able to automatically generate not just test cases and data, but complete end user workflows and step-by-step videos that can be used as training material and onboarding of new members.

It is able to create your end user training documentation directly from the user interactions in the system, keeping the training materials always up to date, versioned and with visibility on the changes on your process and system flows, including manual and system steps. It is well positioned to help banks create and manage all the training material and maintain a knowledge base on day-to-day operations, optimize their staff training and increase staff engagement by obtaining the knowledge the users need to implement new technologies faster.
