

Taking DevTestOps to the **next level**

- **Accelerate software delivery**
- **Innovate faster and Delight your customers!**

Validata Group is the leader in the Enterprise Software market for DevOps and Continuous Testing for Temenos Core Banking and WealthSuite, delivering on the promise of full automation and predictive analytics and ensuring our customers achieve agility @ scale to unlock and accelerate their digital transformation initiatives.

It provides the only unified DevOps and Continuous Testing platform, capable of integrating with both open source and commercial software such as HP QC, CA Clarity, Atlassian Jira etc, and delivering a 'single version of the truth' across all projects. It enhances DevOps pipelines, linking business, development and operations enabling faster product delivery with visibility ensuring an optimal digital experience and 'delighting' customers by meeting their business goals.

It offers a unique approach, focused on the only indicator that matters: The End User. It validates, predicts and monitors the user experience both before and after each release, across multiple channels of engagement focusing on testing the true, end-to-end user journey.

Validata's cutting edge technology can help banks accelerate and predict application delivery, optimize business risks and reduce costs. Accelerating time to market and delighting customers are the keys to success in the digital world.

✓ Validata Quality Suite

Bridge DevOps with Continuous Testing using a unique Model-Based Test Automation approach

Validata's Quality Suite for Continuous Testing can help you connect testing with development and operations, and automate the design, development, quality assurance and deployment of new applications and systems, achieving automation levels of over 90%.

It is the most mature, easy to use, scriptless, no-code platform that radically accelerates the delivery of digital testing powered by industry-leading model-based test automation, agile test data management and provisioning, service virtualization, and more. Leveraging AI, machine learning and analytics it intelligently navigates applications, searches for bugs and increases user experience with better quality, increased productivity and lower costs.

Through its **AI-driven technology** it captures and stores all the business knowledge from the application under test and automatically generates 'ready to use' test scenarios grouped together with test requirements, covering the complete Temenos software stack supporting AA, country layers, local layers and core functionality.

Through this zero-touch test case creation and maintenance, we can capture and store transactions and real user actions from production without user intervention. The test cases created can be reused again and again as they are upgradable and sustainable so you have an always up-to-date regression suite which is critical in validating Temenos patches and upgrades and how these can impact your critical business processes.

In order to optimize reusability and help banks accelerate their testing projects we have created a pre-built library of test assets which are the foundation for all types of testing across the complete Temenos software stack.

With a self-service Business Intelligence and Analytics functionality, it collects all the data from the different projects and tools you use and transforms them into actionable insights, focusing on what to test and on the health and quality of your projects, **to enable better and faster decisions in real-time through the 30 pre-built KPIS it has!**

✓ Validata Release Automation Suite

Accelerate end-to-end DevOps & Continuous Delivery for Temenos Core Banking!

Validata Release Automation Suite supports a comprehensive DevOps process by providing integration between development, testing and release automation, enabling Continuous Delivery with automated testing.

It is an agile end-to-end continuous delivery platform and has been designed to address the complexity and constant changes in Application Development without a large team of developers to support it.

The solution enables Configuration Management, Deployment and Release Automation and Monitoring to effectively monitor and control Temenos T24™ environments.

It enables Temenos Core Banking clients successfully transform to a Digital Bank, by implementing end-to-end DevOps practices that address complex parallel and distributed development environments while accelerating development processes and improving asset reuse.

By adapting Continuous Delivery, Validata makes it possible through reliable, low-risk releases, to continuously adapt software in line with user feedback, shifts in the market and changes to business strategy. **QA and DevOps can work together as one delivery team to automate and streamline the build.**

✓ V-Conn Dynamic Data Platform

Make your data fast, secure and compliant across the enterprise

V-Conn is a dynamic data platform able to present information from multiple data sources, thus presenting "one version of the truth" by interacting with external systems and performing: Data Migrations, Automated ETL Testing, Data Profiling, Data Validation, Data Archiving, Data Quality, Financial Reconciliation and Audit and Continuous Data Integration.

Our Data as a Service (DaaS) functionality eliminates significant infrastructure costs for core banking upgrades and delivers data to project teams faster, while significantly accelerates the pace of development and testing.

V-Conn enables organisations to maintain compliance, improve quality and coverage and accelerate time-to-market through:

- Data Masking
- Data Subsetting
- Synthetic Test Data Generation
- Test Data Virtualisation
- Self-service data provisioning and delivery
- Data as a Service (DaaS)
