

Validata SAS Test Factory™

Think Globally, Act Locally

For Financial Institutions, survival in a dynamic and complex environment depends upon the success of day-to-day operations which are driven by high volume events conducted in real-time.

Considering the complex range of skills required for quality assurance, industry knowledge of the business and its applications, it is difficult to build consistency and best practice into test functions, especially as some specific skills are not needed full time. Few companies can afford to establish best practice standards, methodologies and the tools and resources needed for the levels of end-to-end testing and the stringent quality assurance standards required today.

As Software-as-a-Service (SaaS) becomes the predominant model for delivering software, the separation between firms providing software and services will blur.

Instead of running a QA department yourself, our Managed Services enable the application to be tested on a shared data center. By establishing a shared services methodology, you can support testing of applications across the enterprise, sharing test environments, leveraging existing investments and maintaining high quality assurance whilst reducing costs.

This type of shared services approach is delivered within the Test Factory™ solution.

Validata SAS Test Factory™

We take a new approach to delivering quality application projects as and when you need them. Validata SAS Test Factory™ is equipped to support the peaks and troughs of your quality control and testing requirements, leaving you to focus on your business. You concentrate on your core competence and we deliver on ours.

The Test Factory™ represents technical expertise on quality management operations that cover both Quality Assurance (QA) and Quality Control (QC) offered as a service on a global level.

Taking advantage of our proven methodology, pre-built content and templates, we can help you accelerate the time to value of your Quality Assurance road-

map. Once the Test Factory™ is up and running, we will deliver the services as per the defined service plan, with our offsite capabilities providing additional services such as maintenance, automated script development in a cost effective model.

Uniquely, the Test Factory™ is also able to offer pre-delivered **Temenos T24™ Project Accelerators** and Best Practice. A generic Model Bank approach, Core business processes, Data Privacy, Test Case and Regression Test Cycle accelerators are available as well as pre-built accelerators for **SWIFT, AML and SOA Testing**. This, in combination with our adapters which enable **tight integration with Temenos T24™** (through Web, Desktop and OFS) and other core applications used within the application environment, delivers automation 'out of the box'.

The benefits

- **Improved efficiency:** getting the right skills at the right time.
- **Transform project delivery:** predictability in timelines simplifies planning and reduces costs. It all starts with a Quality Model.
- **Standardization of Quality Assurance policy:** skills transfer, industry "best practice" and ready Temenos T24™ Project Accelerators.
- **Instant time to value:** flexible level of resources to support peaks by establishing a software test lifecycle parallel to the development one.
- **Reduced Risk** with a comprehensive Risk based Approach

The path to higher quality and productivity improvement

Test Factory™ is our solution to the industry's requirement of an enterprise level testing organization. It is a centralized testing group that will serve specific, named software applications for a given customer. It will help in streamlining the testing processes and eliminate the risk and uncertainty involved in ad-hoc

testing. It is operated on the basis of pre-determined Service Level Agreements (SLAs).

Validata Group jointly with its partners operates the Test Factory™. Our unique model helps to optimize the overall team size without impacting the quality of testing, and will also optimize the overall cost by sharing infrastructure and tools across different applications teams.

Test Data Privacy

Before outsourcing your testing activities, you need a systematic approach to test data management.

Validata SAS delivers powerful data transformation capabilities to mask personal information, so it can be used safely for application testing. Validata SAS enables users to work effectively with data and secure its privacy using disguise techniques like encryption, masking, translating, aging, etc.

We have the expertise to implement data privacy assurance in the testing environment and the technology to deliver quality data. With Validata SAS, your organization establishes data integrity across all applications, consistency of data regardless the data source and repeatability as well as re-usable, valid and meaningful data.

Delivered with best in class partner channel

Validata Group takes pride in its partnership model and we are proud of our track record. Our “customer first” mantra guarantees that we will do whatever it takes to solve the most difficult challenges.

The Test Factory™ allows us to deliver flexibility to the customer through proven models with partners. These partner relationships vary from the provision of specialist expertise through to joint solutions with partners delivering the full consultancy and execution aspects of the engagement.

Test Factory™ Service Offerings:

- Process Consulting
- Resourcing
- Automation
- Legacy Data Migration
- Content Accelerators
